

Second User Feedback / Formative Evaluation 2

1 Session overview

Session type: Second formative user feedback

Project stage: Late-stage interactive prototype

Session date: 2026-04-30

Duration: Approximately 20–30 minutes

Participant: 1 user from our intended target group

Method: Guided exploration + think-aloud feedback during repeated interaction with the system

2 Participant profile

The participant was a potential target user of our system and had experience using GitHub repositories and web-based collaboration tools. The participant interacted with the latest version of the prototype by logging in, connecting repositories, switching between repositories, exploring the dashboard, checking team ranking, and testing the goal management flow.

3 Goal of the session

The purpose of this session was to evaluate:

- whether the latest version of the application feels stable during repeated use,
- whether repository connection and switching are clear,
- whether the dashboard works as a concise summary page,
- whether the goal creation and management flow is understandable,
- whether synced teammates and contributor information are displayed clearly,
- and whether the interface gives useful feedback without being too noisy.

4 Tasks / walkthrough focus

During the session, the participant explored and commented on the following core parts of the system:

- navigation and overall layout,
- login and saved data expectations,
- repository connection and switching,
- repository selector behavior,
- dashboard layout and summary information,
- active goal display,
- goal creation and draft saving,
- goal editing and deletion,
- goal status badges,

- synced teammates,
- team ranking,
- and About page explanation.

5 Main feedback from the participant

The participant felt that the core idea of the application was clear and useful. They understood that the app helps teams track GitHub-based contribution progress and create team goals based on repository activity.

However, the participant also felt that some pages still needed clearer structure. In particular, the dashboard should not repeat too much information from other pages, and the goal system should feel like a complete flow from creation to tracking.

6 Detailed feedback points

- The dashboard should focus on the most important current information instead of showing many repeated modules.
- The dashboard should show the latest active goal clearly, while still allowing users to view all active goals when needed.
- If there are multiple active goals, they should be shown in a scrollable dialog rather than making the dashboard crowded.
- The goal creation flow should support a complete lifecycle, including creating a goal, saving a draft, editing, deleting, and viewing status changes.
- Goal states such as active, scheduled, expired, completed, and draft should be easier to recognize.
- Status explanations should not take too much visible space. Short badges with hover information would be clearer.
- Repository actions should be clearer. Already connected repositories should be shown as switchable instead of appearing like they need to be connected again.
- Synced teammates should reflect repository contributors more accurately.
- The synced teammate count should not show misleading numbers before contributor data has loaded.
- The app should avoid too many toast messages. Feedback should mainly be shown for important success or error actions.
- Technical database details do not need to appear in the main workflow. They are more suitable for the About page.

7 Observed usability problems

From this session, we identified five main usability issues:

1. Dashboard information hierarchy

The dashboard originally contained too many sections and repeated content from other pages. This made it harder to understand the page as a quick overview.

2. Incomplete goal management flow

The participant expected the goal system to support the full process of creating, saving, editing, deleting, and tracking goals.

3. Unclear repository action labels

Repository actions were not always clear. The participant wanted clearer labels for current repositories, connected repositories, and new repositories.

4. Unreliable synced teammate display

The synced teammate count could appear incorrect before contributor data was fully loaded, which reduced trust in the displayed information.

5. Overly technical or noisy feedback

Some technical explanations and frequent toast messages made the interface feel more complicated than necessary.

8 Planned improvements after this feedback

Based on the session, we implemented or planned the following changes:

- Simplify the dashboard and remove duplicated sections.
- Show only the latest active goal on the main dashboard.
- Add an Active Goals dialog for viewing all active goals.
- Make the Active Goals dialog scrollable when there are multiple active goals.
- Improve the goal creation and management flow.
- Support clearer goal states, including active, scheduled, expired, completed, and draft.
- Allow users to save drafts, continue editing drafts, edit goals when allowed, and delete goals.
- Improve goal status badges and move longer explanations into hover information.
- Improve repository selector behavior with clearer current, switch, and connect states.
- Improve synced teammate handling so contributor information is more accurate.
- Avoid showing misleading synced teammate counts while contributor data is still loading.
- Reduce unnecessary toast messages and keep feedback focused on success and error states.
- Simplify the About page and keep technical storage details away from the main workflow.

9 Reflection

This second feedback session was useful because it tested the prototype after more complete interaction, not only during first-time use. The participant helped us see that the dashboard needed to become simpler and more focused, and that the goal system needed a clearer full workflow.

Compared with the first evaluation, several earlier issues had improved, such as repository switching, page structure, and feedback messages. However, this session showed that the next priority should be dashboard clarity, goal lifecycle completeness, and more reliable synced teammate information.

The feedback helped us refine the final prototype into a cleaner and more understandable application. The dashboard now works more like a summary page, while detailed goal and ranking features are kept in their own areas.
